PRODUCT ROADMAP · 2026–2027

Sanad سند

The Complete Experience Blueprint

A four-persona product roadmap for the Sanad legal operations platform. Built on a live audit of the current V1.0 Alpha release, it defines what lawyers, clients, students, and visitors must experience at every stage — from first visit to daily reliance — and sequences the work into three priority tiers with acceptance criteria, dependencies, and measurable KPIs for each feature.

4 PERSONAS | 18 FEATURE SPECS | P0 / P1 / P2 TIERS | 16 KPIS

Sanad Product Team — فريق سند

Legal OS for Saudi compliance and law practice · منظومة المحاماة الذكية

OCTOBER 2026 · VERSION 1.0

SECTION 01

Executive Summary

Sanad (سند) already proves its core promise on the landing page: an intelligent legal operations system for Saudi lawyers, with live drafting simulations, ZATCA-compliant invoicing, and a sovereign local-first architecture. The platform ships with a disciplined security posture, a working PWA install flow, and trust pages (privacy, terms, AI disclosure) that many early-stage competitors neglect. What it does not yet have is a **complete experience** — a coherent journey for every person who touches the product, whether that person is evaluating it, relying on it daily, learning from it, or waiting for news about a case.

This roadmap closes that gap. It is built on a live walkthrough of the production site conducted in October 2026, which surfaced both strengths to protect and specific friction points to remove: there is no public pricing page, the invitation requirement appears only after a visitor commits to registering, the login form is not accessible to screen readers, native browser validation interrupts users in English on an otherwise Arabic product, and — most significantly — the platform's most valuable future persona, the law firm's own client (الموكل), has no surface at all. Each of these findings became a feature specification in this document.

The work is organized into three priority tiers. **P0 — Must-Have** removes conversion blockers and protects paying users: pricing, a self-serve sandbox, lawyer onboarding, and a deadline alert engine. **P1 — High-Value** builds differentiation: the client portal, document approval with e-signature, online invoice payment, role-based access, offline sync, and a unified notification center. **P2 — Growth & Pipeline** compounds the moat: a verified student tier, structured learning paths with AI grading, spaced-repetition study, a trainee-to-firm marketplace, public legal content for SEO, and firm analytics. Every feature is written as a developer-ready spec with a user story, acceptance criteria, dependencies, an edge-case list, and one KPI that defines success.

4	18	3
PERSONAS COVERED	FEATURE SPECS	PRIORITY TIERS

16
TRACKED KPIS

The operating principle: each persona must experience a full loop — arrival, activation, daily value, retention, advocacy. A feature list is not an experience. When any persona's loop breaks, growth stalls no matter how strong the drafting engine is. This roadmap is sequenced so that no loop stays broken for long: P0 unblocks entry, P1 deepens reliance, P2 compounds the network.

SECTION 02

Persona Framework & Gap Analysis

Every roadmap decision in this document serves one of four personas. They are not user segments in the marketing sense — they are distinct loops with distinct jobs-to-be-done, and a feature that serves one can quietly harm another if roles are not separated. A student, for example, needs generous freedom to practice and fail; a lawyer needs the platform to never lose work or miss a deadline; a client needs clarity without jargon. The cards below summarize what each persona is trying to achieve, where the current V1.0 Alpha experience stops short, and which features in this roadmap close that distance.

The Visitor — الزائر

Prospective lawyer, firm owner, or student evaluating Sanad

JOB TO BE DONE

"Help me judge within five minutes whether this platform is serious enough to run my legal work on."

CURRENT GAPS

No pricing page to self-qualify; invitation-only requirement revealed after registration friction; no shareable link previews; demos are excellent but stop before the commercial question.

The Lawyer — المحامي

Practicing attorney or small firm owner, the paying persona

JOB TO BE DONE

"Nothing slips — no deadline, no renewal, no hearing — and my clients must feel I am fully on top of their matter."

CURRENT GAPS

No guided onboarding for the first week; deadline reminders exist as a concept but lack a delivery engine (WhatsApp/SMS); offline claim not yet a courtroom-grade capability; no owner-level reports.

The Student / Trainee — الطالب والمتدرب

Law student or trainee lawyer building practical competence

JOB TO BE DONE

"Turn what I memorize into skill employers can see, and show me a path into a real office."

CURRENT GAPS

Academy exists as flashcard demos but lacks a verified free tier, structured learning paths with progress, AI-graded drafting practice, and any bridge into employment.

The Client — الموكل

The law firm's own customer — absent from the product today

JOB TO BE DONE

"Where does my case stand, what happens next, what do you need from me, and what do I owe?"

CURRENT GAPS

No portal, no case visibility, no invoice delivery, no document approval. Clients experience Sanad as invisible — the lawyer's tool, not their window. This is the platform's largest opportunity.

The matrix below maps the standard SaaS experience loop onto the four personas. It is the reference frame for the tier system: P0 features repair **arrival and activation** where loops are broken today, P1 features build the **daily-value and retention** layer — especially for the client — and P2 features manufacture **advocacy** that feeds new visitors into the top of the funnel. Read any row top-to-bottom to understand a persona's full journey, or any column left-to-right to see what a single stage demands across the platform.

Stage	Visitor	Lawyer	Student	Client
Arrival	Landing, demos, pricing, shareable previews	Targeted landing per practice area	Academy landing with free tier promise	Invite message from the firm
Activation	Sandbox workspace, signup	Onboarding wizard, first contract drafted	First graded exercise completed	Magic-link accepted, first timeline view
Daily value	—	Morning briefing, alerts, drafting, invoicing	Study streak, spaced repetition	Status clarity, documents, payment
Retention	—	Data depth, reports, offline trust	Certificates, progress history	Habit of checking the portal first
Advocacy	Shares content, refers peers	Impresses clients via portal	Joins a firm that uses Sanad	Recommends the firm to others

SECTION 03

P0 — Must-Have Features

P0 Unblock Conversion · Protect Paying Users

Ship these before anything else. They remove friction that silently kills signups today, and they harden the daily loop of the persona who already pays. Each item is small enough to ship in weeks, not quarters.

F-01 Public Pricing Page

VISITOR

> *"As a firm owner evaluating Sanad, I want to see plans and prices without talking to sales, so that I can qualify the platform before investing time."*

The landing page invites visitors to "start free," but the register page then reveals an invitation requirement — a trust-breaking bait-and-switch moment. A public pricing page converts the commercial question from a hidden answer into a filter that brings qualified signups and repels mismatched ones politely.

ACCEPTANCE CRITERIA

- Route **/pricing** renders three tiers — Lawyer, Firm, Student — in Arabic-first layout with annual and monthly toggles.
- Each tier lists included capabilities mapped to real features (drafting engine, invoice volume, portal seats, academy access).
- Student tier displays as free with verification note; Firm tier includes a "contact for onboarding" secondary action.
- Pricing page is linked from every CTA that currently says "start free" and from the footer.
- Page renders an Open Graph preview image for social sharing.

DEPENDENCIES

None. Pure frontend plus copy review.

KPI

Pricing-page exit rate below 40%; visitor-to-signup conversion reaches 3%.

EDGE CASES

Price changes require a changelog entry; VAT display must be explicit (inclusive/exclusive) for ZATCA-minded buyers.

F-02 Self-Serve Sandbox Workspace

VISITOR

> *"As a visitor, I want to click once and play inside a realistic firm workspace with demo data, so that I can feel the product before creating an account."*

The homepage demos prove drafting intelligence but are single-screen simulations. A sandbox turns curiosity into embodied experience: a pre-seeded firm with two clients, three cases, draft contracts, and one due invoice. The sandbox is read-write but disposable, and it converts: a user who has drafted one contract in the sandbox arrives at registration already activated.

ACCEPTANCE CRITERIA

- "Try the live workspace" CTA opens a sandbox session without registration, capped at 30 minutes per visit.
- Sandbox is seeded with demo firm, clients, cases, and documents; all writes are isolated per session.
- A persistent banner shows remaining time and a "save my progress — create account" conversion action.
- On expiry, data is purged with a confirmation toast; no sandbox data ever mixes with real workspaces.
- Rate-limited per IP to prevent abuse; sandbox sessions are excluded from analytics activation metrics.

DEPENDENCIES

F-05 (accessible forms) recommended; demo data set creation.

KPI

25% of sandbox users create a real account within 7 days.

EDGE CASES

Anonymous heavy usage (cost control via session cap); users attempting real client data entry — show clear "demo mode" watermark.

F-03 Lawyer Onboarding Wizard

LAWYER

> *"As a new lawyer, I want a guided first-run that sets up my firm, invites my team, and shows me a completed example, so that I reach value on day one instead of facing empty screens."*

Empty dashboards are the quietest churn driver in B2B SaaS. The wizard compresses setup into five steps and seeds the workspace so the first session ends with a drafted contract, a tracked deadline, and a felt sense of control — the product's emotional promise.

ACCEPTANCE CRITERIA

- Five steps maximum: profile, firm details, invite colleagues (skippable), practice areas, first matter creation.
- Progress indicator with resume-on-relogin; no step blocks exit to the dashboard.
- After completion, dashboard is seeded with one sample matter and one upcoming deadline the user just created.
- Sample data is clearly labeled and one-click removable.
- Wizard is skippable entirely, but skipping is tracked as an analytics event for funnel diagnosis.

DEPENDENCIES

F-10 (RBAC) for colleague invites; analytics event schema.

KPI

Time-to-first-value under 15 minutes; 80% of new lawyers draft a contract in session one.

EDGE CASES

Invitee accepts after inviter churned; firm name changes later; user abandons at step 3 — resume state must be intact.

F-04 Deadline Alert Engine

LAWYER

> *"As a practicing lawyer, I want critical deadlines to reach me on WhatsApp or SMS before they are missed, so that my compliance never depends on remembering to open an app."*

Statutory periods (المدد النظامية) are the single highest-stakes data in the product. Email digests are not enough in Saudi legal practice; delivery must be proactive, redundant, and quiet-hours-aware. This engine is also the foundation the client portal later reuses for client-facing reminders.

ACCEPTANCE CRITERIA

- Deadline entities support T-7, T-3, T-1, and same-morning alert offsets, configurable per firm.
- Channels: in-app (always), WhatsApp and SMS (per-user opt-in), email digest (daily 7:00 AM AST).
- Escalation: an unacknowledged critical deadline re-alerts after 12 hours to the user and firm owner.
- Alert content includes case name, deadline type, statutory basis, and a deep link that marks it acknowledged.
- Hijri and Gregorian dates both render; all times are Asia/Riyadh with unambiguous formatting.

DEPENDENCIES

WhatsApp Business API approval (lead time 2–4 weeks); SMS gateway contract; deadline data model already exists.

KPI

Deadline-miss rate approaches zero; 90% of critical alerts acknowledged within 2 hours.

EDGE CASES

Provider outage fails over to the secondary channel; clock ambiguity around Hijri conversion; user disables WhatsApp after a missed message — channel health shown in settings.

F-05 Arabic Validation & Accessibility Fixes

PLATFORM

> *"As any Arabic-speaking user, I want every form message and every focusable control to work in my language and with my assistive technology, so that the platform feels native and professional."*

The audit found native browser validation surfacing in English ("Please fill out this field") on the login form, and zero of three inputs programmatically associated with their labels — a WCAG failure that also breaks password managers and test automation. These are small fixes with outsized credibility effects for a compliance-branded product.

ACCEPTANCE CRITERIA

- All forms use **noValidate** with custom Arabic messages; no English browser tooltips can appear.
- Every input has a programmatic label (label[for] or aria-label); screen-reader announcement verified on register, login, and sandbox flows.
- Viewport pinch-zoom restored (remove maximum-scale=1) to satisfy WCAG 1.4.4.
- Focus-visible styles and logical RTL tab order verified across all forms.
- Automated check added to CI that fails builds containing unlabeled inputs.

DEPENDENCIES

None. One focused engineering day per form.

KPI

Zero a11y criticals in quarterly scan; form completion rate +10%.

EDGE CASES

Third-party embeds must inherit the same rules; password-manager incompatibilities regression-tested after noValidate.

F-06 Social Previews & SEO Foundations

VISITOR

> *"As a visitor who just heard about Sanad on X or WhatsApp, I want the shared link to show a professional preview, so that my first impression matches the product's quality."*

The audit found no Open Graph or Twitter Card tags and no sitemap.xml. For a B2B product that spreads through lawyers' professional networks, link previews are free brand impressions on every share. The sitemap and robots tuning prepare the ground for the P2 content hub.

ACCEPTANCE CRITERIA

- Every public route emits og:title, og:description, og:image (1200×630, Arabic-first), and twitter:card summary_large_image.
- og:image generated per route from a template with the Sanad brand frame.
- sitemap.xml generated automatically from the public route manifest and referenced from robots.txt.
- Canonical URLs set on all public pages; hreflang prepared for a future English locale.
- Preview rendering verified in the major platforms' debuggers before release.

DEPENDENCIES
Brand OG image asset; route manifest.

KPI
Share-link click-through rate measurable and rising month over month.

EDGE CASES
Authed pages must emit no index; OG images cached aggressively — versioned URLs on brand updates.

SECTION 04

P1 — High-Value Features

P1 Build Differentiation · Open the Client Loop

With conversion unblocked, P1 turns Sanad from a lawyer's tool into a firm's operating system. The client portal is the centerpiece — no mainstream Saudi legal platform gives the الموكل a real window, and the underlying data already lives in Sanad.

F-07 Client Portal MVP

CLIENT · LAWYER

> *"As a client, I want to open a link my lawyer sent and see my case status in plain Arabic, so that I stop calling for updates."*

The portal is a separate, passwordless surface (magic-link OTP by SMS or email) that reads from the matter data lawyers already maintain. MVP scope: case timeline, upcoming sessions, document list, and invoice view. Full screen-by-screen specification lives in the companion document "Client Portal UX Specification."

ACCEPTANCE CRITERIA

- Lawyer invites a client per matter; client activates via OTP within 10 minutes or re-requests.

- Client home shows matters as cards: status in one plain-Arabic phrase, next event date, pending actions count.
- Timeline renders only event types the firm enabled; no internal notes, no other clients' data, ever.
- Every string passes a plain-language review — legal jargon mapped to client wording via glossary.
- Mobile-first RTL layout; core journey usable at 200% zoom and on a 5-year-old Android device.

DEPENDENCIES
F-10 (RBAC) for scoping; F-12 for notification delivery; SMS sender registration.

KPI
70% of invited clients activate within 48 hours; 50% monthly active among activated.

EDGE CASES
Shared family phone; expired links; lawyer offboards client — access revoked within one minute; client disputes a status wording.

F-08 Document Approval & E-Signature

CLIENT · LAWYER

> *"As a client, I want to review the contract my lawyer prepared, comment once, and sign it on my phone, so that the matter moves without a paper chase."*

Documents currently end their journey as files. Making them closeable inside the portal removes the last analog loop: review, comment, approve, sign. E-signature is positioned as simple qualified-consent capture (typed name + OTP confirmation + audit trail), with a stated roadmap toward integration with a licensed Saudi trust-services provider.

ACCEPTANCE CRITERIA

- Lawyer sends a document for review with a due date; client sees it in the portal and via notification.
- Client can approve, or comment per-page; each comment round-trips to the lawyer's workspace in real time.
- Signing flow: view full document, confirm identity via OTP, type legal name, capture timestamp, device, and IP into an immutable audit record.
- Signed PDF is stamped and stored in both parties' document lists; download always available.
- Consent text (Arabic) explicitly states the legal effect of the signature and is versioned.

DEPENDENCIES
F-07 portal shell; document storage with versioning; audit-log infrastructure.

KPI
Median document approval time under 24 hours; 60% of agreements signed in-portal within two quarters.

EDGE CASES
Multiple signers ordering; client requests changes twice; document version changes after signing began — require re-review; accessibility of long PDFs on small screens.

F-09 ZATCA Invoice Delivery & Online Payment

CLIENT

> *"As a client, I want to receive the invoice, see the VAT breakdown, and pay it from the same screen, so that settling up takes one minute."*

Sanad already generates ZATCA Phase-2 style invoices with QR codes. Delivery and payment close the revenue loop: the invoice leaves the platform as a compliant document and returns as settled cash. Payment initially via the firm's payment-gateway account (Mada/Apple Pay/card), keeping Sanad out of the money flow to simplify compliance.

ACCEPTANCE CRITERIA

- Invoice publication pushes a portal record plus SMS/email with a deep link; PDF matches ZATCA field requirements.
- Pay action opens the firm's gateway with amount and reference pre-filled; success and failure both reconcile back to the matter ledger.
- Payment status (paid, pending, overdue) visible to lawyer and client; overdue reminders reuse F-04's engine with client-appropriate wording.
- Partial payments and credit notes render correctly with running balance.
- Receipt issued automatically on settlement and archived to both sides.

DEPENDENCIES

F-07; payment gateway onboarding per firm; F-04 reminder engine.

KPI

Median days-to-payment cut by 50% versus invoicing before the portal.

EDGE CASES

Failed gateway callback (must reconcile idempotently); refund disputes; client pays twice — second attempt blocked or auto-refunded with clear messaging.

F-10 Role-Based Access Control

PLATFORM

> *"As a firm owner, I want precise roles — owner, lawyer, paralegal, trainee, client — so that people see exactly what their responsibility requires, and nothing more."*

Today the platform is effectively single-role. RBAC is the silent prerequisite behind team invites, the trainee experience, and the client portal; it is also a compliance story buyers of legal software expect. Permissions are defined per capability and per matter, not just per menu.

ACCEPTANCE CRITERIA

- Five seeded roles; permissions defined as capability matrix (view, create, edit, delete, share, bill) per object type.
- Matter-level sharing: a trainee can be scoped to specific matters rather than the whole firm.
- Client role is read-mostly, scoped to their own matters only, enforced server-side on every query.
- Owner can transfer ownership; all role changes are audit-logged with actor and timestamp.
- Unauthorized access attempts return a consistent Arabic error and a security event log entry.

DEPENDENCIES

Auth middleware refactor; audit-log table.

KPI

Zero cross-matter data-leak incidents; 100% of new firm workspaces use roles within a month of launch.

EDGE CASES

Role removed while user session active — token revocation within 60 seconds; trainee promoted mid-matter; owner offboarding with sole ownership.

F-11 Offline-First Courtroom Mode

LAWYER

> *"As a lawyer in a courtroom basement with no signal, I want to open my matter, read the file, draft, and capture session outcomes offline, so that the platform never becomes unusable exactly when it matters most."*

Sanad's local-first architecture is already marketed as a differentiator; this feature makes it literally true. The PWA already installs — the work is making the working set (matters, documents, drafts) available offline and synchronizing safely when connectivity returns, with zero silent data loss.

ACCEPTANCE CRITERIA

- Selected matters are pinned for offline; pinned set syncs in background when online (documents up to a size cap).
- Drafting and session-outcome capture work fully offline; entries are marked pending-sync with timestamps.
- On reconnect, sync is conflict-safe: server wins on metadata, local wins on unsaved text, and any true conflict produces a side-by-side resolution card, never an overwrite.
- Offline indicator is always visible; user can preview exactly what will sync.
- Storage quota managed with explicit eviction prompts, never silent deletion.

DEPENDENCIES

Service-worker sync engine; document cache format; conflict-resolution data model.

KPI

Zero reported data-loss events; 95% of pinned matters open within 3 seconds offline.

EDGE CASES

Multi-device edits of the same draft; expired auth while offline — queue re-auth without losing draft; clock skew affecting pending-sync ordering.

F-12 Unified Notifications Center

PLATFORM

> *"As any user, I want one place where everything that needs my attention lands, with control over what reaches me and when, so that I trust notifications instead of muting them."*

Today alerts are implicit in feature plans (F-04, F-07, F-09). A unified center defines the shared contract — event taxonomy, priority levels, channel routing, quiet hours, and digest policy — so each feature plugs in instead of reinventing delivery. It is infrastructure with a visible user surface.

ACCEPTANCE CRITERIA

- Three priorities (critical, update, FYI) with distinct visual treatment and default channel mapping.
- In-app inbox with unread state, per-category filters, and mark-all-read; deep links to the source object.
- Per-user channel matrix (in-app, email, WhatsApp, SMS) with quiet hours honoring Asia/Riyadh defaults.
- Daily digest option that groups routine updates; critical alerts never wait for digest.
- Every notification records delivery, open, and action timestamps for KPI computation.

DEPENDENCIES

F-04 engine; analytics event pipeline; F-10 for role-scoped visibility.

KPI

Notification mute rate under 10%; critical alert acknowledgment within 2 hours at the 90th percentile.

EDGE CASES

Flooding during matter import (rate-limit with rollup); user in another timezone traveling; duplicate suppression across channels.

SECTION 05

P2 — Growth & Pipeline Features

P2 Compound the Moat · Own the Career Pipeline

P2 features manufacture advocacy and future revenue. Students trained on Sanad become lawyers who demand Sanad; firms hire through Sanad; public content feeds the funnel. These bets matter less for this quarter's numbers and everything for the platform's position in three years.

F-13 Verified Student Tier

STUDENT

> *"As a law student, I want free access to the academy and drafting practice with my university email, so that I can build real skills without cost."*

Students are tomorrow's paying lawyers and today's word-of-mouth engine. Verification keeps the tier credible: a .edu.sa address, a university card upload, or sponsorship by a Sanad firm. Access is scoped to academy and practice workspaces — not firm operations — keeping the boundary clean.

ACCEPTANCE CRITERIA

- Signup path with student role; verification via academic email domain list, document upload, or firm sponsor code.

- Student workspace includes academy, flashcards, practice drafting, and a portfolio of graded work.
- Firm-data capabilities (invoicing, client records) are hidden; upgrade path to lawyer tier preserves portfolio.
- Verification expires annually with a grace period and re-verification reminder.
- Abuse controls: one verified account per person; document watermarks "practice mode".

DEPENDENCIES
F-10 roles; verification review queue for document path.

KPI
5,000 verified students in year one; 25% verify within 10 minutes of signup.

EDGE CASES
Graduation transitions; university not in domain list; sponsor firm churns — student keeps earned portfolio.

F-14 Learning Paths & AI-Graded Practice

STUDENT

> *"As a trainee, I want a structured path from drafting basics to litigation documents, graded instantly with explanations, so that practice feels like progress rather than guessing."*

The drafting engine already checks contracts against Saudi labor law articles live on the landing page. Reused as a grader, it becomes an infinitely patient tutor: the student drafts, the engine scores clause-by-clause against the regulation, explains each finding with the article text, and logs mastery over time.

ACCEPTANCE CRITERIA

- Three launch paths — Drafting (الصياغة), Procedure (الإجراءات), Ethics (الأخلاقيات) — each with ordered modules and a final assessment.
- Practice exercises: student drafts a clause; grader returns per-requirement pass/fail with article citation and model language.
- Progress dashboard: module completion, streaks, weakest-clause report; certificate issued per path.
- Grading feedback is deterministic and explains itself; AI involvement disclosed per the platform's AI disclosure policy.
- Instructors (future): firms can author private exercises for their trainees.

DEPENDENCIES
F-13; drafting engine expose as grading API; content authoring with legal reviewers.

KPI
50% of verified students complete a first exercise within a week; 25% complete a full path within six months.

EDGE CASES
Grader disagreement on ambiguous clauses — human review flag; path content updates after student completion (certificate notes syllabus version).

F-15 Spaced-Repetition Flashcards v2

STUDENT

> *"As a student memorizing statutory periods and procedural rules, I want review sessions scheduled exactly when I am about to forget, so that twenty minutes a day compounds into real retention."*

Flashcards exist today as static decks. Version two adds a scheduling brain: an SM-2-style spaced-repetition algorithm per card, daily review queues sized to a commute, and decks aligned to the learning paths so study reinforces practice. Streaks and gentle streak-protection make the habit sticky without shaming lapses.

ACCEPTANCE CRITERIA

- Each card tracks ease and interval; daily queue orders due cards first, capped at a configurable session size.
- Card types: term/definition, article-number recall, and scenario judgment; all RTL-first with clean Arabic typography.
- Decks map to learning-path modules; completing a module unlocks its deck with priority weighting.
- Offline review supported; streaks tolerate one grace day per week.
- Export deck as printable PDF for handwritten study preferences.

DEPENDENCIES

F-13; F-11 offline infrastructure (shared sync engine).

KPI

Weekly review retention: 40% of active students review 4+ days per week.

EDGE CASES

Card content corrected upstream — update propagates without resetting personal scheduling state; exam-season bulk import of custom decks.

F-16 Trainee-to-Firm Marketplace Bridge

STUDENT · LAWYER

> *"As a firm hiring a junior, I want to see verified evidence of a trainee's practical skill — graded contracts, path certificates — so that I hire on demonstrated ability rather than promises."*

This feature welds the two sides of the network together: students who trained on Sanad become the supply channel for firms already running on Sanad. Participation is opt-in on both sides, with the student controlling which portfolio artifacts a firm can view. The marketplace starts as matching and introductions — not payments — keeping regulatory surface small.

ACCEPTANCE CRITERIA

- Students opt in to a hiring profile: portfolio selections, path certificates, verification badge, brief statement.
- Firms post trainee openings with required skills; system surfaces ranked candidates with skill evidence.
- Contact happens through structured introduction requests; both parties can decline without disclosure.
- Profile data is minimal by default; PDPPL consent captured explicitly per shared artifact.
- Hire outcome is markable, feeding a placement metric that becomes platform social proof.

DEPENDENCIES

F-13, F-14; consent management; anti-spam controls.

KPI

100 documented placements in year one; firms posting openings return within 60 days.

EDGE CASES

Discriminatory filtering requests (refuse and log); student withdraws — data removed from firm views; stale openings auto-archive.

F-17 Public Legal Content Hub

VISITOR

> *"As a searcher who just Googled a labor-law question, I want a clear, current, Arabic answer authored by Sanad, so that I discover the platform while solving my actual problem."*

The newsletter (النشرة القانونية) already produces summarized legislation updates for users. Publishing a curated subset publicly converts internal value into an SEO engine: each amendment, explainer, and template guide is a landing page targeting the exact queries Saudi lawyers and small-business owners type. Content pages end with contextual CTAs into the relevant product capability.

ACCEPTANCE CRITERIA

- Public hub at /insights with categories: legislation updates, explainers, drafting guides; Arabic-first URLs and metadata.
- Articles carry author review attribution and effective-date stamps; amended articles interlink and show currency visibly.
- Each article ends with a contextual CTA (e.g., a labor-law update links to the drafting sandbox).
- Content sitemap, structured data (Article schema), and performance budget (core pages under 2s TTFB).
- Editorial workflow with legal-review signoff status tracked per article.

DEPENDENCIES

F-06 SEO foundations; editorial calendar; legal reviewer commitment.

KPI

Organic sessions 10k/month within nine months; 2% of readers enter the sandbox or pricing.

EDGE CASES

Outdated regulation content — automated currency review flags articles older than policy window; Plagiarism/attribution disputes handled by editorial policy.

F-18 Firm Analytics & Compliance Reports

LAWYER

> *"As a firm owner, I want a monthly PDF that shows matters handled, deadlines met, revenue billed, and portal adoption, so that I can run the firm on evidence and show partners the value Sanad delivers."*

Retention at the firm level is political as well as functional: the person renewing the subscription needs ammunition to defend it. A monthly owner-facing report — generated from data Sanad already holds — becomes a forwarded artifact inside the firm, quietly marketing the platform every month at zero marginal cost.

ACCEPTANCE CRITERIA

- Monthly report auto-generated per firm: matters by status, deadline compliance rate, invoicing totals, portal activity, academy progress for trainees.
- Delivered as branded PDF via email and available in-app; owners can schedule recipient lists.
- Comparative trend (month over month, year over year) with plain-Arabic narrative summaries.
- All figures computed server-side from audit-grade queries; no client-identifying data leaves the firm boundary without consent.
- Export underlying CSV for owners who want raw numbers.

DEPENDENCIES

F-04, F-09, F-12 data; PDF rendering service; F-10 for owner-only scoping.

KPI

70% of firms open the monthly report; annual renewal rate above 85% for report-opening firms.

EDGE CASES

Firms with zero activity (report becomes an encouragement nudge, not an empty table); mid-month billing period changes; partner-vs-owner visibility disputes default to owner-only.

SECTION 06

KPI Framework

A roadmap without measurement is a wish list. The KPI set below assigns every persona two to four metrics with explicit definitions and targets, so that after each P0 or P1 release the team can answer one question: did this feature move its number? Two rules keep the dashboard honest. First, **activation is defined per persona as a completed action, not a signup** — a visitor activates by drafting in the sandbox, a lawyer by drafting a real contract, a client by opening their timeline, a student by finishing a graded exercise. Second, every metric names its instrumentation at launch, because a metric discovered to be untracked after release is a quarter wasted.

Persona	Metric	Definition	Target
Visitor	Visitor-to-signup conversion	Unique landing visitors creating an account within 30 days	≥ 3%
	Sandbox activation rate	Sandbox sessions reaching a drafted document	≥ 60%
	Sandbox-to-account conversion	Sandbox users creating a real account within 7 days	≥ 25%
Lawyer	Time-to-first-value	Signup to first real contract drafted	< 15 min
	Week-1 retention	New lawyers active on 3+ distinct days in week one	≥ 60%
	Deadline-miss rate	Critical deadlines missed per 100 tracked	→ 0
Client	Invite acceptance	Invited clients activating within 48 hours	≥ 70%
	Portal monthly activity	Activated clients opening the portal in a month	≥ 50%
	Days-to-payment	Median days from invoice delivery to settlement	−50%
Student	Student activation	Verified students completing a first graded exercise	≥ 50%
	Path completion	Started paths completed within 6 months	≥ 25%
	Review cadence	Active students reviewing flashcards 4+ days weekly	≥ 40%
	Student NPS	Quarterly in-product survey	≥ 40

Leading versus lagging. Sandbox activation, onboarding completion, and invite acceptance are leading indicators — they move within days of a release and predict the lagging outcomes (retention, renewal, placements) that take quarters to compound. The weekly product review should open with leading indicators and reserve lagging indicators for the monthly report, preventing overreaction to noise while still catching genuine regressions early. Every KPI in the table above maps to a named feature in Sections 03–05, which is what makes this roadmap auditable at the next planning cycle.

SECTION 07

Rollout Sequencing & Foundations

Sequencing follows dependency, not ambition. P0 items are deliberately small and independent so the team can ship weekly and build momentum. P1's client portal needs RBAC (F-10) and the notification center (F-12) before its first invite is sent, so those two land first inside the tier. P2's student features reuse the offline sync engine and roles built in P1 — by the time the academy scales, the platform plumbing is already proven on paying customers. Nothing in P2 blocks anything in P1: they can overlap once P0 is stable.

Wave 1 — P0 Foundations

F-05 a11y fixes, F-06 SEO, F-01 pricing, F-02 sandbox, F-03 onboarding, F-04 alert engine. Ship in weeks; measure conversion lift immediately.

Wave 2 — P1 Platform

F-10 RBAC and F-12 notifications first; then F-07 portal MVP, F-08 e-sign, F-09 payments, and F-11 offline mode. This is the differentiation wave.

Wave 3 — P2 Growth

F-13 student tier, F-14 paths, F-15 flashcards, F-16 marketplace, F-17 content hub, F-18 analytics. Overlaps with Wave 2 once P0 is stable.

CROSS-CUTTING FOUNDATIONS

- [ ] **Analytics event schema** — define the event dictionary (signup, sandbox_draft, portal_open, exercise_graded) before Wave 1 ships; every KPI above reads from it.
- [ ] **Notification bus** — one internal service that F-04, F-07, F-09, and F-12 all publish through; prevents channel spam and duplicated delivery logic.
- [ ] **Design system tokens** — the emerald brand palette, Arabic typography rules, and RTL component patterns codified once, reused by every feature.
- [ ] **Feedback loop** — a two-question in-product widget and quarterly NPS per persona; qualitative signals explain quantitative ones.
- [ ] **Compliance guardrails** — PDPPL data-map maintained as features ship; AI usage documented per the platform's AI disclosure page.

> **Biggest risks to manage now:** WhatsApp Business API approval can take weeks — start the application during Wave 1, not when F-04 is coded. Payment-gateway onboarding per firm is a sales task, not an engineering one — assign an owner early. And the content hub (F-17) lives or dies on legal review capacity — recruit the reviewer relationship before the editorial calendar exists.

NEXT ACTIONS CHECKLIST

- [ ] Approve tier scope and KPI targets in this document; assign a single owner per feature.
- [ ] Start WhatsApp Business API and SMS sender registrations this week (longest lead-time items).
- [ ] Ship F-05 and F-06 immediately — they are days of work with visible credibility returns.
- [ ] Prototype the client portal with five friendly firms' clients; validate the plain-Arabic wording before writing the full spec into sprints.
- [ ] Review this roadmap at the end of Wave 1 against the leading KPIs and re-tier P2 as evidence arrives.

SANAD سند · LEGAL OS

One platform. Four complete experiences.

This roadmap turns Sanad's demonstrated intelligence into a complete experience system: visitors who convert, lawyers who never miss, clients who always know, and students who grow into the profession through the platform that served their teachers. The next step is a single decision — which wave starts this sprint.

PRODUCT ROADMAP · VERSION 1.0 · OCTOBER 2026
